# WHAT CAN AI DO FOR YOUR FLEET?

Fleet AI Action Plan | Start small. Give it context. Check the result.

**01 / EXPLORE AI Start with a low-cost, approved chat service.**

## 1 Four ways to use AI

Choose the kind of help you need. These are different uses, not maturity levels.

### A EXPLORE / Think with me.

Ask questions using a defined information context. Compare, analyze and draft; a person directs the conversation and checks the answers.

### B BUILD / Build a repeatable tool.

Use AI to write code for a rules-based solution. The finished software may not need AI at runtime. Test it: repeatable does not mean correct.

### C AUTOMATE / Do the work.

Run known steps as a workflow; use a bounded agent when steps need judgment. Separate reading, drafting and taking action. [1]

### D GUIDE / Walk me through it.

Help someone follow an approved standard operating procedure (SOP). Ask required questions, reference the procedure and escalate exceptions.

## 2 Models & services: similar core capabilities, different fit [2]

**ChatGPT | Claude | Gemini | Microsoft Copilot | Grok**

All offer overlapping AI-assistant capabilities. The model does the reasoning and generation; the service adds the interface, tools and controls. Start with one approved service. Compare results, integrations, privacy and limits—not brand loyalty. Features vary by plan.

## 3 COST: START WITH THE LOWEST-COST APPROVED PLAN [3]

Use an existing company license, a suitable free tier, or the cheapest subscription that meets your needs. **Do not buy API credits or token top-ups to begin.** Upgrade only for a demonstrated limit or required business controls.

**Tokens** are chunks of input and generated output, not exact words. **API access** lets software call a model and is generally billed separately by usage. Save APIs for a defined integration. Local models add hardware and support responsibilities; local is not automatically free or secure.

## 4 Prompts: make the job clear [4]

### ROLE + CONTEXT + GOAL + LIMITS + OUTPUT

Give the task, approved sources, definitions, constraints and an example of a good result. Ask for missing inputs, supporting records and a specific format. Improve one instruction at a time.

### LOAD THE INSTRUCTIONS AT THE START

Save recurring guidance in the service's **custom or project instructions**, not just a chat message. In ChatGPT: Settings > Personalization > Custom Instructions; for fleet-specific guidance, use Project settings. Project instructions override global instructions within that project.

These are user-configured standing instructions—not access to the provider's system prompt. For a new session, request a brief check of the task, sources and limits.

### TRY THIS

"Using these reports and definitions, list fleet exceptions with source records, dates and missing information. Separate findings from possible explanations. Use a table; do not invent values."

## 5 Memory: save a useful handoff [5]

### SUMMARIZE → REVIEW → SAVE → RELOAD

Keep one workspace per topic and two small, versioned documents: a **Fleet Brief** for stable context and a **Session Handoff** for ongoing work.

At session end, ask for verified facts and sources, decisions, open questions, next actions and items needing rechecking. Review the draft; approve and save it with a date. At the next session, supply the current version and ask what is stale or missing.

Use project-scoped memory where available. Do not assume chat history preserves every detail or that asking to save creates a file—confirm the actual save.

### REMEMBER CONTEXT. REFRESH FACTS.

Retain approved terms and preferences; re-query current vehicle status. Exclude secrets and unnecessary personal data. Limit sharing; set review/expiry dates and correction/deletion rules. Memory can preserve errors or leak information.

**YOUR FIRST SESSION: Create an approved workspace. Add standing instructions, a fleet brief,** a glossary and one sample report. Ask one question; verify the answer.

# MAKE AI USEFUL TO YOUR COMPANY

Better information. Appropriate tools. Repeatable methods. Verified results.

## 6 Data: add meaning, not just files [6]

Start with approved **databases, ERP, telematics, documents, emails and reports**. Identify the owner, authoritative source, access rules, version and update date.

### BUILD A SMALL COMPANY KNOWLEDGE KIT

Include a fleet overview, sample data, approved SOPs, a glossary and an example output. Use consistent vehicle IDs. Define units, status codes, time periods, relationships, formulas and missing-data rules.

**Example:** Does “utilization” mean miles, engine hours or days available? Are emergency reserves excluded? Make those decisions explicit before asking for conclusions.

### CONNECT ONLY WHAT THE TASK NEEDS

Start with approved uploads. **RAG** retrieves relevant source material before answering; it does not retrain the model or guarantee accuracy. For live facts, later add approved read-only database/API access. Never treat an old export as current.

## 7 Tools: start with built-ins [7]

A **tool performs an operation**. Useful starting choices are file reading, web search with sources, spreadsheet/code analysis for calculations, and document creation.

Add approved email, calendar, document-store or ERP connectors only when needed. Begin read-only; let AI draft before it can send or update. Tool availability varies by service and plan.

## 8 Skills: reusable ways of working [8]

A **skill packages instructions, examples, templates and sometimes scripts** for a recurring task. It may use several tools. The terms vary by platform; skills and tools are not the same thing.

**Tool:** read a spreadsheet or create a document.
**Skill:** prepare the weekly fleet briefing using approved definitions, checks and report format.

Use vetted skills—or document your own repeatable method. A skill does not automatically grant permission to data or tools.

## 9 REDUCE HALLUCINATIONS [9]

A confident answer can still be fabricated or wrong. Give approved evidence and definitions; require source records, dates and “not enough information” when needed. Open and check cited sources.

Use calculations or tested code for numbers. Test known answers, missing data and exceptions. Ask what evidence is absent—not for a confidence percentage. A second model or another prompt is not proof.

**Keep improving:** narrow the task, show a good example, save corrected prompts and measure review time as well as output speed. Risk can be reduced, not eliminated.

## SECURITY & SAFETY: KEEP CONTROL [5, 10]

Files, emails and websites can hide instructions that try to redirect an assistant. Treat their contents as evidence, not authority. Review downloaded skills, scripts and connectors before use.

Protect driver/customer information and credentials. Check retention and sharing. Enforce permissions outside the prompt; require approval for sends, updates and consequential actions.

**A prompt is not a security boundary.** Keep vehicle-release, safety-critical maintenance and compliance decisions with qualified reviewers and approved procedures.

## 02 / TRY A PILOT Hypothetical fleet applications—not promises of savings.

Pick one useful task. Use approved data, a named reviewer and a measurable before/after result.

### A EXPLORE / Find a question worth answering

- Compare fuel/energy costs and utilization across similar vehicles; identify missing explanations.
- Audit software subscriptions (SaaS): paid vs. active seats, features used, overlaps, renewals and must-have functions.

### B BUILD / Create a repeatable tool

- Prototype a delivery-exception form, record importer or approved cost-per-mile calculator.
- Assess an AI-assisted replacement for a narrow SaaS workflow. Compare retain, downgrade, consolidate or build; include migration, hosting, security, support and exit costs.

### C AUTOMATE / Reduce recurring administration

- Draft a weekly maintenance/utilization exception briefing for approval.
- Flag missing proof-of-delivery records or upcoming software renewals; draft follow-ups.

### D GUIDE / Help people follow the process

- Walk staff through approved vehicle onboarding or delivery-exception documentation.
- Find the correct version of a fleet procedure, ask required questions and escalate exceptions.
